NOTE: The above list of companies manufacture machines that are being used to apply our Supamark™ heat transfers. All of the machines have adjustable heat, dwell time, pressure and have automatic feed for the transfer roll.

To apply Transfers, the operator places the piece to be stamped under the upper heated platen, then activates the machine to lower the transfer and heated upper platen down onto the piece. The machine will apply pressure for a specified dwell time using a pneumatic cylinder. After the dwell time is reached, the upper platen will raise, releasing the paper from the piece, and then the paper is advanced to a new transfer. The operator will then remove the printed piece and begin the cycle again. These manufacturers can also make special turntables and fixtures for holding your piece, which can increase production.
